FEATURES DESIRABLE TO HAVE IN A SECURITY CONSULTANT

CONTINUOUS CONSULTING

1. **"One call, total security"** so you can integrate several unique products/services via one business partner, rather than multiple unrelated vendors in purchasing.
2. **Professional expertise** to meet government regulations in Homeland Security, to do audits of risk, design solutions, establish a corporate security program with contingency plans, supervise installation, provide training, and maintain systems with service contracts.
3. **Cross-functional teams of experts**, so you can integrate their specialties in access control, service contracts, personal protection, investigations, surveillance, counter measures and hazardous material management.
4. Suppliers who are not beholden to a specific product line, so **recommendations are based on your needs** and not on a vendor's inventory.

COMPLETE SYSTEM

1. **"Seamless integration"** of access control, CCTV, photo ID, guard tour, facility management, elevators, time & attendance, and alarm map monitoring with emergency instructions, so you don't have to leave one program to get into the other program.
2. **"Scalable architecture"** to begin with 1-2 doors, and expand up to 128 doors in one location, and expand up to 32,000 locations, so you can have plenty of room for coordinated growth.
3. **Protective services** including executive protection, dignitary protection, on-site law enforcement, surveillance, electronic sweeps, hostile terminations, neighborhood canvassing (gated communities), etc.
4. **Investigative services** including internal theft, embezzlement, burglary, construction accidents, kidnapping, sexual harassment, background checks, truth verification, interview & interrogation, technical security counter measures, personal investigations (threat of violence and deceit), corporate investigations (spying, sabotage and theft), insurance and medical fraud (false claims and gather evidence), undercover operations, and serving warrants.

DESIRED PRODUCTS & SERVICES

1. Security Consultants have over **100 years of security experience**, so they will give great advice.
2. **Technical Security Counter Measures (TSCM)**, like surveillance, and sweeps for electronic bugging devices, so you can **proactively protect** people, property and information.
3. **Seamless integration of CCTV and EAC**, so you can have digital video verification of access and documentation for investigations.
4. Only use **law enforcement officers**, so they will be trained to legally collect evidence that will be admissible in a court of law.
5. Installers are **factory trained** by manufacturer, so they can service what they sell.
6. **No "seat license,"** so you can use the access control software in up to 99 workstations at the same price, including remote sites.
7. **Interactive "help screens"** so if you have a question, you can press the help key while in that area of the software, and be taken directly to help on that subject, without having to hunt for the right help screen.
8. **Unlimited access levels per cardholder**, so you can customize your system.
9. **Customized user-defined fields**, so the systems administrator can set up your data base to capture what is important to you.
10. **"Distributed intelligence"** on each door controller board, so in a power outage all cards with the facility code will NOT act as a "grandmaster."
11. **"Backward compatibility,"** so if you expand your system, it will be compatible with your current system's components.
12. Will accept input from **up to 170 different reader formats**, so you can use various access token technologies in retrofits and expansions.
13. The door controller boards and software are from the **same manufacturer**, so you can have maximum compatibility.
14. **"Real-time"** processing and communication, so you do not have costly delays in information.
15. **Customized reports**, so you can effectively investigate crime and manage your security.
